

Fig. 1. Alyxia olivaeformis Gaud.,
forma retusa St. John, from
holotype. Leaf X 1.

NOTES ON NEW AND NOTEWORTHY PLANTS. XCII

Harold N. Moldenke

PREMNA MARIANNARUM f. DENTATA Moldenke, f. nov.

Haec forma a forma typica speciei foliorum laminis margine grossedentatis recedit.

This form differs from the typical form of the species in having the margins of its leaf-blades coarsely dentate with rounded or obtuse, rather low, sparse teeth.

The type of the form was collected by M. V. C. Falanruw (no. 3132) in a shrubby area along the southwest coast of Guguan island, northern Marianas Islands, at an elevation of about 9 meters, on July 12, 1975, and is deposited in the United States National Herbarium at Washington.
